## **1.0 Scope and Applicability**

This standard operating procedure (SOP) describes the method for extracting and preparing dermal wipe and surface wipe samples for analysis of acidic persistent organic pollutants.

## **2.0 Summary of Method**

The method for extracting and preparing a dermal wipe and surface wipe sample for analysis of acidic persistent organic pollutants is summarized in this SOP. It covers the extraction and concentration of samples that are to be analyzed by gas chromatography/mass spectrometry (GC/MS).

## **3.0 Definition**

- 3.1 Surrogate Recovery Standard (SRS): The compounds that are used for QA/QC purposes to assess the extraction and recovery efficiency obtained for individual samples. Known amounts of these compounds are spiked into the wipe sample prior to extraction. The SRSs are quantified at the time of analysis and their recoveries indicate the probable extraction and recovery efficiency for native analytes that are structurally similar. The SRSs are chosen to be as similar as possible to the native analytes of interest, but they must not interfere in the analysis.
- 3.2 Internal Standard (IS): The compounds that are added to sample extracts just prior to GC/MS analysis. The ratio of the detector signal of the native analyte to the detector signal of the corresponding IS is compared to ratios obtained for calibration curve solutions where the IS level remains fixed and the native analyte levels vary. The IS is used to correct for minor run-to-run differences in GC injection, chromatographic behavior, and MS ionization efficiency.

## **4.0 Cautions**

Standard laboratory protective clothing, gloves, and eye covering are required.

## **5.0 Responsibilities**

- 5.1 The project staff who perform the sample extractions will be responsible for obtaining samples from the sample coordinator, entering relevant information in the extraction/preparation laboratory record books, and sending final extracts for analyses.

- 5.2 The CTEPP Laboratory Team Leader (LTL), the QA Officer, and Task Order Leader (TOL will oversee the sample extraction operation and ensure that SOPs are followed by all project staff.

## **6.0 Apparatus and Materials**

### **6.1 Materials**

- 6.1.1 Dionex Accelerated Solvent Extraction (ASE) instrument (Model #200)
- 6.1.2 Silylated collection vial with open top caps B up to 60 ml capacity
- 6.1.3 Cellulose fiber filter B 1.93 cm (Dionex B grade D28, part number 049458)
- 6.1.4 Silylated clean glass wool
- 6.1.5 Analytical syringes
- 6.1.6 Silylated wide-neck glass funnels (muffled)
- 6.1.7 Large Kim-wipes (15" x 15")
- 6.1.8 Latex gloves
- 6.1.9 Silylated 1.8 mL glass GC vials with Teflon-lined screw caps; muffled
- 6.1.10 Silylated Kuderna-Danish concentrators (large 24/40 3-ball Snyder condenser, 125 mL or 250 mL reservoir flask and 25 mL tube); (Kontes 570000)
- 6.1.11 Silylated small 19/22 3-ball Snyder condensers
- 6.1.12 Disposable glass pipettes (muffled and stored in clean glass jar)
- 6.1.13 Vortex mixer (American Scientific Products)
- 6.1.14 Graduated cylinders

6.1.15 Heated water bath

6.1.16 Silylated clean glass vials

6.1.17 11- or 22-mm stainless steel extraction cell

6.1.18 Collection vial septa, teflon/silicone (I-Chem - 288-72-22)

6.1.19 Quartz fiber filters

6.2 Reagents

6.2.1 Acetonitrile (ACN); distilled-in-glass

6.2.2 Methanol (distilled-in-glass)

6.2.3 Boiling chips (Hengar crystals)

6.2.4 Surrogate Recovery Standard Spiking Solution

6.2.5 Internal Standard Spiking Solution

6.2.6 Distilled, deionized water (DI water)

6.2.7 Diethyl ether (EE); distilled-in-glass

6.2.8 Reagent grade Ottawa Sand

6.2.9 Sodium sulfate anhydride

6.2.10 Diazald

6.2.11 Carbitol (analytical grade)

6.2.12 N-(tert-butyltrimethylsilyl)-N-methyltrifluoroacetamide (MTBSTFA), Pierce Chemical company

6.2.13 37% KOH aqueous solution

## 7.0 Procedure

### 7.1 ASE, Concentration, Methylation, and Silylation.

7.1.1 To the extent possible, retrieve up to 24 samples from the same materials batch from the freezer. Extract and analyze these samples as a batch.

7.1.2 Put on clean gloves.

7.1.3 For each sample or blank, screw one end cap of the steel cell onto the chamber and place one cellulose fiber filter onto the top of the end cap. The filter should cover the frit on the end cap. Place 1.0 gram of clean sand on top of the filter.

7.1.4 Place the wipe sample in the cell and spike the wipe sample with 50  $\mu$ L of the surrogate recovery standard spiking solution, using a 50 or 100  $\mu$ L syringe. *Note that the spiked levels may be changed and the exact spiked amounts will be recorded in the laboratory record book.*

7.1.5 Place ~7 g of clean sodium sulfate anhydride in the bottom of the cell; fill the cell with sand; and then tighten the other end cap of the cell.

7.1.6 The 11-mm (or 22-mm) extraction cells should be used with the 40 ml (or 60 mL) capacity collection vials. Place the open top caps with the septa teflon side down onto the collection vials.

7.1.7 Place the cells and the collection vials on the ASE unit.

7.1.8 Set the ASE parameters as follows:

Pressure:	2000 psi
Solvent:	Acetonitrile
Temperature:	120C
Heat:	5 minutes
Static:	5 minutes
Flush:	100 %
Purge:	60 seconds
Cycles:	3

7.1.9 A total of 24 cells can be extracted as a set. After extraction is complete, remove cells and

collection vials from the ASE unit.

- 7.1.10 Using a wide-neck funnel with a clean quartz fiber filter, pour the extract from the collection vial into a Kuderna-Danish concentrator (KD) which has a 125 mL reservoir flask. Rinse the round-bottom flask twice with ~1 mL ACN and add the rinsate to the KD flask.
- 7.1.11 Add 3-5 boiling chips to the KD tube/flask. Attach the large Snyder condenser to the flask if using 250 mL adaptor. Attach the small Snyder condenser to the flask if using 125 mL adaptor.
- 7.1.12 Concentrate the extract in a heated (~90 °C) water bath to ~10 mL. Rinse the adaptor with ACN; remove the adaptor; and replace the large Snyder column to a small Snyder column if necessary. Continue concentrating the sample to ~1 mL.
- 7.1.13 Rinse down the insides of the flask and tube with ACN, to bring the volume to 2 mL. Vortex for 3 seconds to mix.
- 7.1.14 Spike the extract with 10 µL of the Internal Standard spiking solution, and vortex for 3 seconds to mix. Split the sample extract into two portions (I and II).
- 7.1.15 Transfer each portion of the extract, using a muffled disposable glass Pasteur pipette, to a clean 1.8 mL GC vial. Mark the volume on the side of the vial and label the sample with the laboratory notebook number and field sample ID. The target analytes for the portion I sample extract are dicamba, 2,4-D, pentachlorophenol, and 2,4,5-T.
- 7.1.16 Add 50 µL of methanol to the portion I of the sample extract and methylate it with ethereal diazomethane generated in situ from Diazald, carbitol, and 37% aqueous KOH.
- 7.1.17 Spike 100 µL of MTBSTFA using a 100 µL syringe into portion II of the sample extract. Vortex for 3 seconds to mix. The target analytes for the portion II sample extract from North Carolina field study are 3,5,6-trichloro-2-pyridinol (3,5,6-TCP). The target analytes for the portion II sample extract from Ohio field study are 3,5,6-TCP, and 2-isopropyl-4-methyl-6-hydroxypyrimidine (IMP).
- 7.1.18 Seal the vial with a Teflon septum and placed the vial in one well of the tube-heater sand bath or oven at 65° to 75°C. Record the exact temperature and starting time in the laboratory record book.

- 7.1.19 Remove the GC vial from the heater after one hour. Record the exact temperature and ending time.
- 7.2 Store the extract in a freezer ( $\leq -10^{\circ}\text{C}$ ) until GC/MS analysis.

## **8.0 Records**

- 8.1 Records of the preparation of field samples, blanks, and matrix spikes will be retained in a LRB that is kept in the extraction laboratory. This LRB will record all sample preparation activities. These samples will be recorded in the LRB by field sample ID and the laboratory generated QA/QC sample will be assigned with a laboratory sample number (a unique number that combines the 5 digit LRB number-2 digit page number-2 digit line number). The date of extraction, the lot number of solvents used for extraction, and the spike level of the surrogate recovery standards and internal standards will be recorded in the LRB.
- 8.2 The LRB will be retained in the laboratory where these operations are performed until the conclusion of the study and will be archived in a secure room for three years after completion of the study.

## **9.0 Quality Control and Quality Assurance**

- 9.1 QC/QA samples will include a field blank, laboratory method blank, and laboratory fortified blank, consisting of a clean wipe material that will be extracted together with the field samples. The field blank analyses are performed to verify that minimal contamination occurs through sample handling during shipping and field operations. The laboratory method blank analyses are performed to verify that minimal contamination occurs through sample preparation. The laboratory fortified blank analyses are performed to verify the recoveries of analytes during preparation procedures.
- 9.2 Field crews will be reminded to wear clean clothing and shoes, to remove all pesticide products from their residences that may contain these analytes, and to refrain from using these materials while part of the field crew. Field crews will also be reminded to obtain clean clothing after visiting a home where they know or suspect that target pesticides have been applied within the previous week. Cigarette smoking is not permitted during the field sampling. Field crews should store the samples in a clean environment away from any known combustion sources.

- 9.3 Surrogate recovery values of 50-150% in blanks, and actual samples will be deemed acceptable, and no correction to the data will be made. The data will be flagged for recoveries less than 50% or greater than 150%. The concentration of the surrogate spiking solution will be checked against a calibration curve for recoveries greater than 130%, to determine whether inadvertent solvent loss has resulted in higher spike levels. If this has occurred, the surrogate spiking solution will be re-prepared and re-analyzed.
- 9.4 One laboratory method blank that is analyzed as a sample concurrently with a field sample set will be analyzed for typically every 50 samples processed. If significant target analyte levels ( $>0.1 \mu\text{g}$ ) are found in the field blanks, the source of contamination must be identified and more laboratory blanks, together with additional field blanks, trip blanks, and storage blanks, will be analyzed.
